App Specification Document — “FieldHearts”

1. Vision & Purpose

FieldHearts is a mobile and web application that connects people who need help with everyday manual or local tasks to nearby freelancers or skilled individuals.
It is a mix between **Fiverr** and **Kijiji**, focusing on **local, in-person services** such as lawn mowing, plumbing, cleaning, painting, babysitting, delivery, or any other personal or home-related job.

The goal is to make freelancing **accessible to everyone**, even those without formal businesses, while giving local professionals and small service companies a platform to gain visibility and clients. All of that managed through a single, secure app.

2. Core Value Proposition

- **For clients:** Easily find, book, and pay reliable local workers with verified profiles and reviews.
- **For workers:** Offer skills, find nearby clients, and get paid securely without needing a website or marketing budget.
- **For both:** Transparent reviews, fair payment handling, and secure transactions.

3. Key Features

3.1. User Accounts

Similar to **Kijiji** where everyone can be buyer or seller, every user can act as both:

- **Client (buyer)**: Someone looking for a service.
- **Worker (freelancer)**: Someone offering services.

Registration options:

- Email, Google, or Apple Sign-in (choose the simplest for MVP)
- Phone verification (optional for MVP, but planned for later)

Profile fields:

- Profile picture
- Full name or nickname
- Verified checkmark (optional for MVP)
- Short biography / “About Me”
- Location (auto-detected or set manually)
- Skills offered (select from list or custom input)
- Photos of past work (optional)
- Ratings and reviews (average stars, number of jobs completed)

3.2. Service Listings

Workers can **create service offers** or respond to client posts.

Each service listing includes:

- Title (e.g., “Lawn Mowing”, “Plumbing Repair”, “House Cleaning”)
- Short description
- Category (home, transport, beauty, etc.)
- Estimated price (fixed or hourly)
- Location (radius-based visibility)
- Availability schedule (optional for MVP)

3.3. Search & Discovery

- **Location-based results:** Users see nearby services or workers first (using geolocation).
- **Filters:** Category, price range, rating, distance.
- **Search bar:** Keyword-based search (e.g., “electrician”, “dog walker”).

3.4. Booking & Payments

- Clients can request a job and confirm with payment.
- Payment is **held in escrow** by the app (using Stripe Connect or similar).
- Once the job is marked “completed” by both parties, funds are released to the worker.
- If disputes occur, the app’s admin can mediate (evidence like photos can be uploaded).
- Option for **partial prepayment** if materials are needed upfront (set by the worker).

Supported transactions:

- Credit/Debit cards
- Apple Pay / Google Pay (via Stripe integration)

3.5. Messaging System

- In-app chat between clients and workers.
- Automatic message templates (e.g., “I’m interested in your service”, “Can you come tomorrow?”).
- Notifications for new messages, bookings, or payment updates.

3.6. Reviews & Ratings

After each job:

- Clients rate the worker (1–5 stars) and leave a comment.
- Workers also rate the client (1–5 stars) and can leave feedback.
  This ensures accountability and reliability on both sides.

3.7. Dispute & Proof System

If a problem arises:

- Both parties can upload **photos or comments** as proof.
- Admin panel receives the case for moderation.
- The escrow payment can be refunded fully or partially based on outcome.

3.8. Admin Dashboard

(Admin panel for managing users and transactions)

- Manage users, reviews, and disputes.
- View all transactions, commissions, and escrow status.
- Adjust commission rate (e.g., 5–10%).
- Suspend or verify accounts.

4. Monetization Model

- **Commission per transaction:** 5–10% fee from each completed job.
- **Premium visibility (future feature):** Paid boost for service listings.
- **Subscription for businesses (future):** Verified badge + advanced analytics.

5. MVP Scope

The MVP should include (can discuss):

Feature	Included in MVP
User registration/login	✅
Profile creation & editing	✅
Search & Discovery / Location-based search	✅
Create/list a service	✅
Booking + escrow payment	✅
In-app messaging	✅
Ratings & reviews	✅
Admin dashboard (basic)	✅
Dispute system (basic photo upload)	✅
Notifications (email or push)	✅

6. Technical Requirements (Just an IDEA. It's up to the CTO to decide)

Frontend (Web for MVP & Mobile in the future):

- **React Native** (for cross-platform mobile app)
- **React/Next.js** (for web version, optional MVP)
- TailwindCSS or styled-components for UI

Backend:

- **Node.js + Express**
- **PostgreSQL** database
- **Stripe Connect** for payments
- **Socket.io** or Firebase for real-time chat
- **JWT** authentication

Hosting:

- **Backend:** AWS, Render, or Vercel
- **Database:** PostgreSQL (hosted via Supabase or Neon)
- **Storage:** AWS S3 for images

7. Security & Compliance

- SSL encryption for all data
- Stripe for PCI compliance
- Escrow logic handled server-side
- GDPR & CCPA compliance for user data

8. Future Features (Post-MVP)

- Real-time job tracking (“worker on the way”)
- Phone verification & ID check for trust
- Subscription plans for verified professionals
- Push notifications for nearby job alerts
- AI-based matching of clients and workers
- Multilingual support (EN/FR and other languages throughout the globe)
- Referral and loyalty system

9. Example User Flow

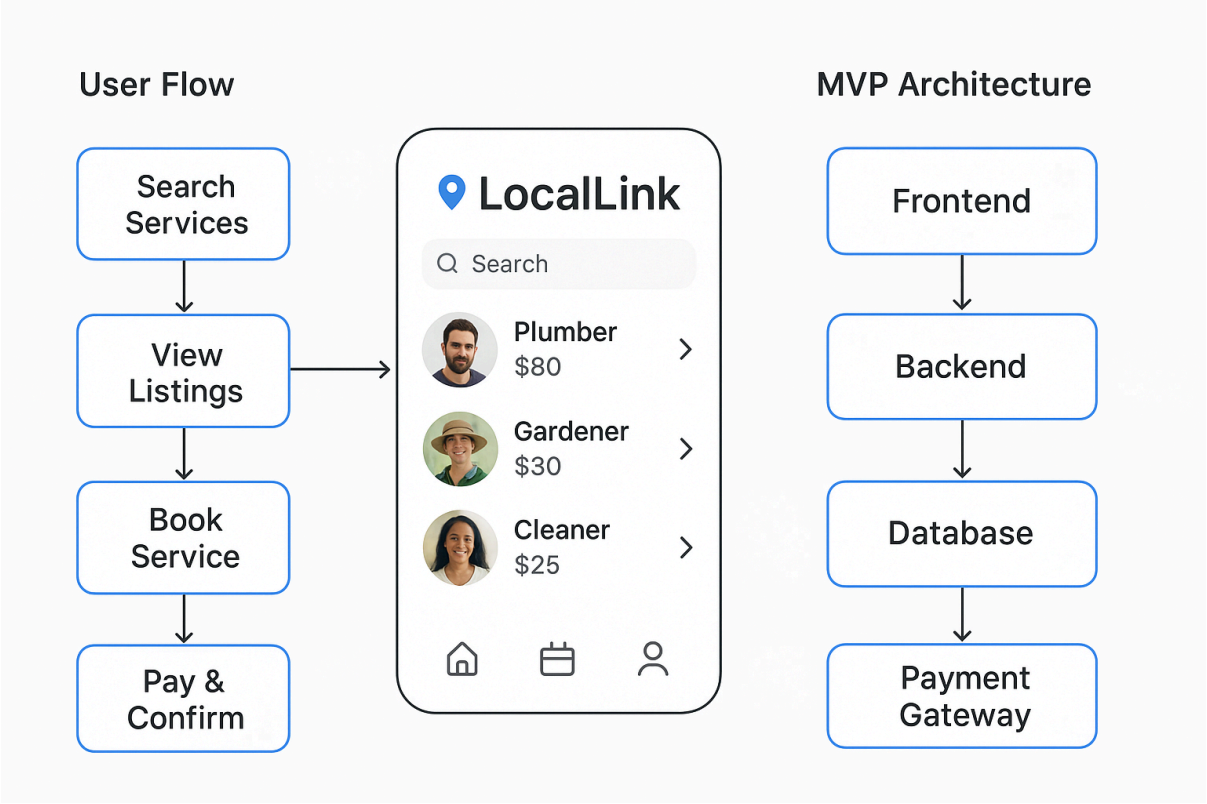
Scenario: Sarah needs someone to fix her leaking sink.

1. She opens the app and searches “Plumber.”
2. She sees 3 local profiles with ratings and chooses “Alex.”
3. She books the service for $80 and pays through the app (funds held in escrow).
4. Alex accepts the job, completes it, uploads photos as proof.
5. Sarah marks it as “Done.” Alex receives payment automatically.
6. Both rate each other and leave reviews.

10. Success Metrics

- Number of active workers and clients
- Number of completed transactions
- Customer satisfaction (average rating)
- Transaction volume per month
- Dispute resolution time

11. Flow Chart (Example)



12. Logo (idea)

- **Font used:** Nunito
- **Color palette**
    - **Primary: Earth green (#3C8C55)**
    - **Secondary:** 🤍 White or beige background
    - **Accent:** ❤️ Deep red (#C0392B),reference to “hearts”
